

Module 6: Real Case Studies

Case studies + CAFS scoping work + YJFS work

Week 3 | Online-Synchronous | Friday

This session moves from frameworks to practice. Fellows will examine **real case studies** where advocates, researchers, and institutions have attempted to intervene in animal agriculture and food systems under real-world constraints.

Rather than presenting “best practices,” the session focuses on **trade-offs, tensions, and strategic choices**—including where welfare, rights, labor, health, and environmental considerations align or come into conflict. Fellows are encouraged to analyze what worked, what did not, and why.

Case Studies

Case Study 1: CAFS Scoping Work on Sow Housing

This case examines the **scoping study on sow housing systems** conducted by [Asia Farming Solutions](#). The study assessed smallholder pig farms across multiple Philippine provinces to understand welfare conditions, farmer constraints, and the feasibility of transitioning away from intensive confinement systems.

Key issues explored include:

- Systemic welfare harms associated with sow confinement
- Farmer risk perceptions in a post-African Swine Fever context
- The limits of immediate abolitionist demands in smallholder settings
- How evidence, pilot programs, and incremental transitions can reduce suffering without worsening farmer precarity

This case allows fellows to analyze how **welfare-based interventions** operate within structural and economic constraints, and how they can still contribute to longer-term systems change.

Case Study 2: Youth for Just Food Systems and the National Youth Agenda

This case examines the development of the **first National Youth Agenda for Just Food Systems**, led by **Youth for Just Food Systems**. The agenda represents a coordinated effort

by young advocates to articulate shared priorities, demands, and policy directions for transforming Philippine food systems through a justice-based lens.

Rather than focusing on a single issue, the agenda integrates concerns across animal welfare, climate justice, food security, labor, public health, and smallholder livelihoods. It demonstrates how animal advocacy can be embedded within broader system change narratives without being isolated or diluted.

Key issues explored in this case include:

- Translating youth values and lived realities into a coherent national policy agenda
- Positioning farmed animal welfare and dietary transition within a multi-issue justice framework
- Navigating coalition-building across diverse movements and constituencies
- Using agenda-setting as a strategy to shift discourse, influence institutions, and create long-term policy pathways

This case allows fellows to analyze **agenda-setting as an advocacy strategy**, highlighting how youth-led processes can generate legitimacy, visibility, and leverage—particularly in contexts where formal political power is limited.

Bridging Exercise – From Understanding to Action

This exercise helps you step back and ask: *Given everything we've covered so far, where might action make the biggest difference—and where might I fit?* Short answers are enough.

Question 1: Spot the Problem Area

Thinking across the previous modules—

- scale and neglect (Module 1);
- climate, health, and environment (Module 2);
- labor and rights (Module 3);
- welfare and rights (Modules 4–5); and
- real-world case studies (Module 6):

Which **problem area** feels most urgent or compelling to you right now?

Question 2: Match Problems to Interventions

Animal Charity Evaluators identifies a [Menu of Interventions](#) commonly used in animal advocacy (e.g., research, policy advocacy, corporate engagement, institutional change, movement building, communications, individual behavior change).

Which **intervention types** seem most appropriate for the problem you identified? You may list one or two. There is no need to justify your choice in depth.

Question 3: Using the SNS Framework, Think in Terms of Impact

Using the **SNS Framework—Scale, Neglectedness, and Tractability**—reflect briefly on your chosen problem or intervention:

- **Scale:** How many animals or people are affected by this issue?
- **Neglectedness:** How much attention or resources does this issue currently receive?
- **Tractability:** Given real-world constraints, how feasible does meaningful progress seem?

Based on these three considerations, does this area seem potentially **high-impact**, or are there clear limits you can already see? A short sentence or bullet points are enough.

Question 4: Locate Yourself

Finally, bring this back to your own position. Based on your current skills, access, and interests, which intervention type feels most realistic for you to contribute to at this stage? This is not a commitment—only a snapshot of where you might start.
